

Planting and care for your vertical garden....

Step 1: Start your seeds

About 6 to 8 weeks before the last anticipated frost, or the start of your normal growing season in your area, start your seeds in small pots or open flats with good drainage. Keep seedlings moist and warm, but not wet, at all times.

Step 2: Fill bag tightly with soil

When your starter plants are 1-2" tall and have formed a good root system, lay the bag flat with the holes side up. Tightly fill the bag with a recommended herb soil mix, which you can purchase at your local garden center.

Step 3: Insert Plants

Gently remove the plants from the starter pots or flats, enough to fill the round openings in the bag. Take special care to keep intact the entire root system for each plant. Remove enough soil in the round circles for the roots then insert the plants into the holes. Tamp around the plants and add extra dirt into the holes until the plants are firmly in place. Water well through the openings in the bag. Note: Keep growing additional plants for use in step 4.

Step 4: Hang your garden

Keep the bag lying flat for about 10 days to allow the plants to become established. When you hang the bag, slowly lift and tilt upright and place two additional plants into the openings at the top of the bag. If needed, add additional soil to the top of the bag to keep the top two plants firmly in place. Hang your garden anywhere that gets at least 4-6 hours of sunlight each day. Continue watering plants frequently. For best results, keep moist at all times. Poke 2 small 1/8" holes in the bottom of the bag to provide additional drainage if needed. Use a genral purpose fertilizer suitable for herbs.

*Best of all your hanging bags are reusable,
so you can plant new vertical gardens each year!*
